Two types of Architecture

Database
Architecture
in DBMS

Dr. Munesh
Singh

- Database architecture in DBMS is logically divided into two types
 - Two tier Client Server architecture
 - Three tier Client Server architecture

Two tier

Database
Architecture
in DBMS

Dr. Munesh
Singh

- Two tier architecture is used for Application Programs that runs on client side
- An interface called ODBC(Open Database Connectivity) provides an API that allow client side program to call the dbms
- Most DBMS vendors provide ODBC drivers.

Two tier Example

Database
Architecture
in DBMS

Dr. Munesh
Singh

Three tier

Database
Architecture
in DBMS

Dr. Munesh
Singh

- Three-tier Client/Server database architecture is commonly used architecture for web applications.
- Intermediate layer called Application server

Database Model in DBMS

Database
Architecture
in DBMS

Dr. Munesh
Singh

Database Model

- Database model is a logical frame in which data is stored
- The model also describes the relationships between different parts of the data

Physical arrangement

Traditional Models

Database
Architecture
in DBMS

Dr. Munesh
Singh

Database Model

- Hierarchical Model
- Network Model
- Relational Model

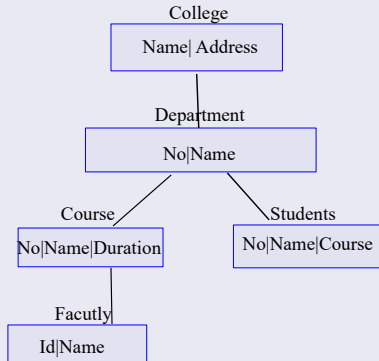

Hierarchical Model

Database
Architecture
in DBMS

Dr. Munesh
Singh

- In this model each entity has only one parent but can have several children
- At the top of hierarchy there is only one entity which is called Root.

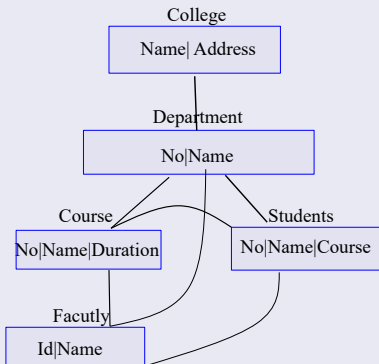

Network Model

Database
Architecture
in DBMS

Dr. Munesh
Singh

- In this model, entities are organized in a graph in which some entities can be accessed through several path

Relational Model

Database
Architecture
in DBMS

Dr. Munesh
Singh

- In this model, data is organized in two-dimensional tables called relations.
- Table in relational model is relation

Code	Description	Type
IND	India	1
USA	United States	1
INR	Indian Rupees	2
USD	Dollars	2

Code	Description	Type
IND	India	1
USA	United States	1
INR	Indian Rupees	2
USD	Dollars	2

Database (db)

RDBMS Concepts in DBMS

Database
Architecture
in DBMS

Dr. Munesh
Singh

- In this model, data is organized in two-dimensional tables called relations.

Logical view (tables)
shows by
DMBS software

What is RDBMS?

RDBMS

- A Relational Database management System (RDBMS) is a database management system based on relational model introduced by E.F Codd
- In relational model, data is represented in terms of tuples(rows).
- RDBMS is used to manage Relational database

Tables

- Relational database is a collection of organized set of tables from which data can be accessed easily
- Database is a collection of tables (conceptually).
- A table is a collection of data elements organised in terms of rows and columns

Few DBMS Terms

Database
Architecture
in DBMS

Dr. Munesh
Singh

Records

- A single entry in a table is called a Record or Row.
- A Record in a table represents set of related data.

Field

- A table consists of several records(row), each record can be broken into several smaller entities known as Fields

Columns

- A column is a set of value of a particular type.
- Sometimes also known as attribute

Overview of Physical Storage Media

Database
Architecture
in DBMS

Dr. Munesh
Singh

Storage medias classification

- Accessing Speed
- Cost per unit of data
- Reliability

Storage Device Hierarchy

- CPU Registers
- Cache
- Main Mememory (physical)
- Flash Memory
- Magnetic disk
- Optical disk
- Magnetic disk
