This is the output of two mouse cursors on monitor.

In the first image, I wrote command **xinput** before inserting external mouse, then after inserting external mouse I again type the same command. My external mouse name is **PixArt USB Optical Mouse** as shown in the terminal. Then i created a second pointer named **Pointer2** using command **xinput create-master Pointer2** and then reattached optical mouse with Pointer2 using its id using command **xinput reattach 9 14.** In this way two mouse cursors appeared on the screen. (No any cursor was shown when i took screenshot using my laptop keys, so i need to take screenshot using mobile camera)

This is the output after removing the created Pointer2 using command
xinput remove-master 14
